

SALSEA-MERGE FP7-ENV-2007-1
Grant Agreement No 212529

Work Package 1

Deliverable - D 3.1

**Report on genetic assignment of archive
samples to river/region of origin**

(Month 30)

Subtask 3.1.2 MSA and IA analysis to identify stock origin

The data derived from subtask 1.4.1 will be used with the optimised assignment protocol from Task 1.4.2 to determine if fish are European and to genetically assign European fish to their region and river/tributary of origin; genetic and phenotypic data on freshwater growth and age of smolting will be integrated into the assignment algorithm; output will be used in Task 4.1

Participants: Lead – 3; other 1,2,7

Table I below outlines the top 20 assignments of the 2290 archival marine fish samples from 1996 to 2007 which could be genetically typed to most likely baseline database rivers of origin and to region of origin. For regional assignment each fish is based on the highest cumulative probability (HCP) for a region based on the sum of scores for rivers from each region for the top 20 assignments. This approach takes into account a much greater amount of information in respect to an individual's likely region of origin. e.g.

	Assign-1/Score-1	Assign-2/Score-2	Assign-3/Score-3	Assign-4/Score-4	Assign-5/Score-5
Fish1:	Den_riv1/0.40	Scot_riv1/0.23	Russ_riv1/0.15	Den_riv2/0.10	Ice_riv1/0.05

Using HCP, its scores for assignment to level 1 regions becomes:

Level 1-South: $0.40 + 0.23 + 0.10 = 0.73$

Level 1-North: 0.15

Level 1-Iceland: 0.05

(Denmark and Scotland are both within Level 1 South; Russia in Level 1 North, and Iceland in Level 1 Iceland)

The fish is thus defined as a Level-South fish with an 'Assignment Score' of 0.73 compared to its assignment to the same region by HSP with a score of 0.40, thus appearing to give a substantially improved assignment probability. This increased assignment score is generally seen for most fish. For a specified level of accuracy (correct assignments), the summed technique will always allow the assignment of more fish. The assignments were carried out using the publically available GENECLASS software programme.

The regions of assignment were carried out at two hierarchical levels – Level 1 (see Figure 1) and Level 4 (see Figure 2).

Table 1 Summary of the temporal distribution of samples assigned from archival marine caught samples assembled for SALSEA-Merge
